     pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are
  Nucleic acids encoding useful for preventing, cancers and metastases

   isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthitis and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

                                 The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune harmolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, allergies, autoimmune themselves and the second of the cancer of the advisors, autoimmune themselves and the second of the cancer of the advisors, autoimmune themselves and the second of the cancer of the advisors, allergies, autoimmune themselves and the second of the cancer of the advisors, allergies, autoimmune themselves and the second of the cancer of the second of the cancer of the advisors, allergies, autoimmune themselves and the second of the cancer of the second of the cancer of the advisors, allergies, autoimmune themselves and the second of the cancer of the second of the cancer of the advisors, allergies, autoimmune themselves and the second of the cancer of the second of the cancer of the advisors, and the second of the cancer of the advisors of

CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) cartivity, and can be used in gene therapy and vaccine production. (I) corrections and polynucleotides may be used in the prevention, diagnosis and camber of diseases associated with inappropriate (I) expression. For cerample, they may be used to treat discorders associated with decreased cexample, they may be used to treat discorders associated with decreased conversion by rectifying mutations or deletions in a patient's genome cc that affect the activity of (I) by expressing inactive proteins or to converse the patients own production of (I). Additionally, (I) converse and treat immune/haematopoietic-related (I), by inserting converse and treat immune/haematopoietic-derived cells. AAK64703 cancers and cancer metastases of haematopoietic-derived cells. AAK64703 converse from the present invention. AAK54942 to AAK54950 and AAM82169 crepresent sequences used in the exemplification of the present invention.

   Delynucleotides and proteins are used to prevent, treat a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. For example, disorders associated with decreased expression of Sps. The Sp polynucleotide or a vector expressing them may be administered to treat diseases by gene therapy. Antisense molecules may be administered to down regulate expression of Sps by binding with the cells own genes and preventing their expression. The polynucleotides may also be used as DNA probes in diagnostic assays. The Sps may also be used as natigens to produce antibodies and to identify modulators (agonists and antagonists) of the Sps. The anti-(Sp) antibodies and antagonists and antagonists for detecting the presence of Sps in samples. The disorders include for example: immune/autoimmune diseases (e.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. morphasms of the breast or liver, Sezary syndrome and Sarkinson's disease) neurological diseases (e.g. Allzheimer's disease, arrest technorardia and analysing infections and whither is disease.

  The present invention relates to biallelic markers derived from human genes involved in central nervous system (CNS) disorders (see AAH88161-AAH88702). The markers have a single nucleotide polymorphism (SNP) and are useful in determining the genetic predisposition of individuals to CNS disorders, by identifying the nucleotides at a set of genetic markers in a biological sample, where the markers comprise at least one CNS disorder related marker. The present sequence was used to illustrate the invention.
  Isolated polynucleotides, useful for genotyping nucleic acids for biallelic markers for the diagnosis of depression, comprises central nervous system disorder related biallelic marker \dot{\ }_{\ |}

   This sequence represents the retinoblastoma binding protein-7 (RBP-7) genomic sequence of the invention. The RBP-7 coding sequence and regulatory sequences are useful for the recombinant production of the protein and for expressing heterologous nucleic acids. Primers and probes derived from the RBP-7 nucleotide sequence (e.g. AAZ87035-Z87099) are useful for DNA amplification and detection methods. RBP-7 biallelic markers (see AAZ8693-Z87034) are useful for diagnosis of disease related to alteration in the regulation or in the coding regions of the RBP-7 gene and for prognosis/diagnosis of an eventual treatment with therapeutic agents, especially agents acting on pathologies involving abnormal cell proliferation and/or differentiation, these include the process of the contract of the cont

   CC disease, particularly coronary artery disease, but also cerebrovascular CC disease, coronary restenosis, and peripheral vascular disease.

CC conversely, a high level of HDL has protective effects against CC conversely, a high level of HDL has protective effects against CC cardiovascular disease. The invention provides genetic constructs and CC transgenic cells and non-human animals comprising human ABC1 nucleic CC acids, and methods of gene therapy for the treatment or prevention of CC cerediovascular disease compounds the administration of an expression CC encompasses compounds which mimic ABC1 activity, compounds which CC stimulate ABC1 expression and methods of screening for such compounds. It further relates to methods for determining whether a patient has an increased risk for cardiovascular disease due to polymorphisms in the CC carebrovascular disease, especially coronary artery disease, CC cerebrovascular disease, especially coronary artery disease, CC cerebrovascular disease, especially coronary artery disease, CC cerebrovascular disease, coronary restenosis or peripheral vascular CC disease. They may also be used in the treatment of disease associated CC with ABC1 biological activity, such as Alzheimer's disease, Niemann-Pick CC disease, Huntington's disease, X-linked adrenoleukodystrophy and cancer. The invention specifically excludes proteins with the exact amino acid cacid with the exact sequence as GenBank Accession No: CAB10005.1 and X75926, and the nucleic CC The present sequence represents a fragment of the human ABC1 gene

   comprising exonic sequences.
   involved in cholesterol efflux from the cell. The gene encoding ABCl is located on chromosome 9q31, and mutations in this gene are associated with two genetic HDL (high density lipoprotein) deficiency disorders, Tangier disease (TD) and familial HDL deficiency (FHA). These diseases are distinguishable in that TD is an autosomal recessive disorder, while FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular
  The invention relates to the human ABC1 cholesterol transporter protein (B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is a member of the AFP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly intracellular cholesterol trafficking in monocytes and fibroblasts, being

  The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and CC oncogenes having a sequence taken from 536 (actually 533 since CC (SS) and sequences complementary to (SS). The nucleic acid may be a CC peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may CC form part of a set of probes for detecting the cytosine methylation state CC and/or single nucleotide polymorphisms and also to be used in an CC carray for analysing diseases associated with CpG dinucleotides e.g. CC cancers and tumours. The probes can also be used in a method for assertaining genetic and/or epigenetic parameters for the diagnosis CC and/or therapy of existing diseases or the predisposition to specific CC diseases, by analysing cytosine methylations. The parameters may be CC compared to another set of genetic and/or epigenetic parameters, the CC differences serving as basis for diagnosis and/or prognosis events which CC are disadvantageous to patients. The present sequence is one of the CC complementary sequences derived from tumour suppressor genes and CC complementary sequence of the corresponding odd numbered sequence (e.g. ID 2 and ID1, ID 536 and ID 535, except for those whose partner sequence (s.g. is missing).

   CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic contivity, and can be used in gene therapy and vaccine production. (I) creatment of diseases associated with inappropriate (I) expression. For ce example, they may be used to treat disorders associated with decreased ce expression by rectifying mutations or deletions in a patient's genome cc supplement the activity of (I) by expressing inactive proteins or to conclude may be used to produce the secreted (I), by inserting cc polynucleotides may be used to produce the secreted (I), by inserting cc protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting cc diagnose and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic antigen genomic cc sequences from the present invention. AAK54942 to AAK54950 and AAM82169 crepresent sequences used in the exemplification of the present invention.

   Human breast cancer expressed polynucleotide 5722.
  The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABCl expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition sele lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.

Barash SC, Ruben SM;

WPI; 2001-451937/48.

Isolated polypeptide for treating, preventing and/or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g.

Example 2; SEQ ID NO 2665; 781pp + Sequence Listing; English.

The invention relates to novel genes (AAL34669-AAL37666) and proteins C (ABB30387-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by C protein or gene therapy. The genes are isolated from a range of human it issues disclosed in the specification. The nucleic acids, proteins, and prevention of: (a) cancer, e.g. breast and ovarian cancer and contribodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and cother cancers of the adrenal gland, bone, bone marrow, breast, and other cancers of the adrenal gland, bone, bone marrow, breast, and discontestinal tract, liver, lung, or urogenital; (b) immune assimilation of discase, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cultiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular discorders such as myocardial ischaemias; (d) wound the line; (e) neurological diseases e.g. cerebral anoxia and epilepsy; caractivity infectious diseases such as viral, bacterial, fungal and

parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format direfrom WIPO at ftp.wipo.int/pub/published\_pct\_sequences. format directly

             During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: MBL; SW:,

RP11-399019 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see,
  http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10
   receptor alpha/delta chain.
AB053451
   This sequence is the entire insert of clone RP11-399019 The true left end of clone RP11-496H23 is at 166408 in this sequence. The true right end of clone RP11-304I5 is at 18704 in this sequence.

Submitted (08-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Mar 12, 2001 this sequence version replaced gi:12964290.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given

  Homo sapiens chromosome 11, clone RP11-348A20
  NOTE: This is a 'working draft' sequence. It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

  The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
EM:, EMBL; SW:, SWISSPROT; Tr:, TREMBL; W:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human hard sequence that the sequence was generated from part of bacterial clone contigs of human hard sequence was generated from part of bacterial clone contigs of human hard sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was generated from part of bacterial clone contigs of human human sequence was 
   together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
  chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9
RP11-54K22 is from the library RPCI-11.1 constructed at the Roswell
  Submitted (12-APR-2000) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
  On Feb 11, 2000 this sequence version replaced gi:6966862. During sequence assembly data is compared from overlapping clones where differences are found these are annotated as variations
  9q34.11-34.2. Contains an MTND3 (mitochondrial NADH dehydrogenase 3) pseudogene, STSs and GSSs, complete sequence.
  VECTOR: pBACe3
   Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/

   During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences wit only a small overlap as described above.

This sequence is the entire insert of clone 37J18. This sequence has been finished according to sequence map criteria as follows. A attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
   Submitted (02-DEC-1998) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requestes clonerequestesanger.ac.uk on Dec 2, 1998 this sequence version replaced gi:3925562.

   ligated to the blunt ends in high | molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

   http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
  melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Oscegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library. Or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
  Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila
  Drosophila melanogaster genome survey sequence T7 end of BAC BACR05E09 of RPCI-98 library from Drosophila melanogaster (fr

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TICR). The BAC library was generated from A. gambiae PEST strain
DNA, All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M University BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII

   adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored.
   Saisho,D.,
   adaptored vector DNA, and transformed into chemically-competent E. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."

91 c 113 g 206 t
  polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The
   was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 was blunt end-repaired with T4 DNA polymerase and T4
  musculus C57BL/6J (male) was obtained from the Jackson

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  This invention describes a novel p53-binding region of a human CD95 receptor DNA molecule. The p53-binding region, or a vector containing it, can be used to screen for apoptosis-modulating substances potentially useful for cancer chemotherapy. This sequence represents a fragment of the human CD95 receptor promoter which is capable of

  defined as the Fas gene promoter region. This includes a number of transcription factor binding sites. A coding sequence for the N-terminal portion (AAR99471) of the Fas protein leader peptide is also included. The DNA segment was isolated from a human placental DNA library using a 32P-labeled segment of human Fas cDNA corresponding to nt 23-346. It can be combined with a structural gene so that the gene is under the transcriptional control of the transcription factor binding sites. The promoter region can be used to regulate Fas gene expression, e.g. in tumour or immune cells, as a means of treating Fas-mediated apoptosis disorders such as

   RESULT
   This cDNA sequence codes for cpk (see AAW38757), a Drosophila polypeptide that belongs to a novel class of phosphatidyl inositol 3-kinases that contain a C2 domain, are capable of phosphorylating a D3 hydroxyl of an inositol ring in phosphatidyl inositol and capable of property inositol and phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol and capable of protein sorting. Short fragments of cpk cDNA were obtained from a sorting. Short fragments of cpk cDNA were obtained from a companie were used to screen the CDNA library to obtain larger fragments, and missing 5' ends were obtained by RACE. A recombinant host cell, transfected with a vector comprising a cpk nucleic acid is claimed. Novel phosphatidyl inositol 3-kinases can be used to screen for agonists/antagonists of activity and in a claimed method of treating a disorder caused by dysregulation of a growth factor activation signalling cascade. The invention relates to isolated breast tumour proteins and conclude acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the corrections. Also included are expression vectors expressing the proteins and substitute the proteins or concluded and antibodies raised against the proteins and can antigen presenting cell expressing the protein. The proteins and concluded with inappropriate breast tumour protein expression, concluded with inappropriate breast tumour protein expression, concluded with inappropriate breast tumour protein expression, concluded and breast cancer e.g by gene therapy. The nucleic acids and their complements may also be used as DNA probes in diagnostic casanys to detect and quantitrate the presence of similar nucleic acids in concludes, and therefore which patients may be in need of restorative concludentify modulators (e.g. antagonists) of breast tumour protein concludes and antibodies may also be used to down regulate expression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used constant and the proteins in the presence of the proteins in the presence of the proteins in the presence of the proteins in the constant assay (ELISA)) and in other constant and present tumour cDNA library isolated by subtractive

   This sequence encodes a novel human type II gonadotropin-releasing hormone receptor (GnRHR II) polypeptide. This protein and its products can be used for identifying compounds which modulate GnRHR II-mediated metabolism in cells. Compounds identified as agonists or antagonists can be used for treating hormone-dependent tumours. Agonists and antagonists may also prove useful in the study of GnRHR II-directed neuromodulation of sexual behaviour, e.g. agonists may be used in the treatment of diminished libido and impotence. The products can also be
   New isolated type II gonadotropin-releasing hormone receptor - used to develop products for use in the treatment of hormone-dependent tumours or for neuromodulation of sexual behaviour

  Novel receptor dna useful for identifying apoptosis-modulating substances potentially useful for cancer chemotherapy Patent: DE 19847/79-C 1 03-FEB-2000; DEUTSCHES KREBSFORSCH (DE)
   corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw:, was compared to the MCRNDEP of t
  AX026089.1 GI:10187520
  on Aug 31, 2001 this sequence version replaced gi:14161146. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission.

   NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 54 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as
  runs of \tilde{N}, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
   as soon as it is available and the accession number will be preserved.
  Consensus quality: 145908 bases at least Q40 Consensus quality: 152564 bases at least Q30 Consensus quality: 158487 bases at least Q30 Estimated insert size: 150457; sum-of-contigs estimation Quality coverage: 0x in Q20 bases; agarose-fp estimation Quality coverage: 2.7x in Q20 bases; sum-of-contigs estimation

1 (base 1 to 1814)
1 (base 1 to 1814)
   sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are artifacts associated with the generation of cDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcription of unspliced precursor RNAs, and reverse transcriptase errors that result in single base changes. For further information about this sequence, including its location and relationship to other sequences, please visit our Web Site (http://fruitfly.berkeley.edu) or send email to

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Listing first 45 summaries
  Perfect score:
   OM nucleic - nucleic search, using sw model
   Total number of hits satisfying chosen parameters:
   Scoring table:
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). The retinas were obtained from a 55 year old Caucasian and total cellular poly(A)+ RNA was extracted 6 hrs after their removal. The retina RNA was kindly provided by Roderick R. McInnes M.D. Ph.D. from the University of Toronto. Library constructed by Bento Soares and M.Fatima Bonaldo. "

   double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pTTT3 vector (Pharmacia). The retinas were obtained from a 55 year old Caucasian and total cellular poly(A)+ RNA was extracted 6 hrs after their removal. The retina RNA was kindly provided by Roderick R. McInnes M.D. Ph.D. from the University of Toronto. Library constructed by Bento Soares and M.Fatima Bonaldo. "

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Result
No.
  Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries
   Minimum DB seq length: 0
Maximum DB seq length: 2000000000
   Total number of hits satisfying chosen parameters:
  Scoring table:
  Run on:
   OM nucleic - nucleic search, using sw model
   Database
  00000
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Human Ship-2 nucleotide sequence SEQ ID NO:1.
   22-MAY-2000
  This invention describes a novel p53-binding region of a human CD95 receptor DNA molecule. The p53-binding region, or a vector containing it, can be used to screen for apontosis-modulating substances potentially useful for cancer chemotherapy. This sequence represents a fragment of the human CD95 receptor intron 1 which contains a p53 bin region described in the method of the invention.

   The present invention describes phosphorothioate antisense oligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinositol phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothicate antisense oligonucleotides. The phosphorothicate

  used in a vaccine or for gene therapy. The proteins and nucleic acids may be used for the investigation of the function of the Meg-3 protein and its role in the pathogenesis of kidney disease and for the treatment, prevention and diagnosis of kidney disease in which mesangial cell proliferation is implicated, such as glomerulonephritis and diabetes.

   Sequence 1110
   The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a coding sequence of the
   WPI; 2001-465570/50.

  The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of fill length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

X
  CC in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or caseepe. A pathological condition can be determined by determining the presence or absence of a mutation in a cytoskeletal polynucleotide. The CC treatable disorders include autoimmune diseases such as rheumatoid CC arthritis, hyperproliferative disorders such as neoplasms of the breast CC or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, crivases and fungi, ocular disorders such as corneal infection, endocrine CC disorders such as Premature labour and infertility, gastrointestinal CC disorders such as Crohn's disease, renal disorders such as asthma. The CC disorders such as Crohn's disease, renal disorders such as asthma. The CC due to sumburn, to maintain organs before transplantation, to regenerate CC tissues and in chemotaxis. The polypeptides can also be used as a food cadditive or preservative to increase or decrease storage capabilities.

CC Note: The sequence data for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO

   The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be use in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding protein of the invention.

  The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
  830\ \mathrm{Primers} useful for synthesizing full length cDNA clones and their use in genetic manipulation -

   This DNA encodes a human secreted protein. The specification provides secreted protein sequences (AAW63691 to AAW63699) encoded by the nucleic acid sequences shown in AAV43611 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine
